Dear Earl,

I have been in Greece for few days and just got a telegram from the Lucas gallery asking to contact you and send you the number of V. of the sculptor. I hope really you can do something that will be very exciting if you did not come to Paris. But anyway. Here a small plan of the sculptor with the exhauster of V.

Loud speaker, absorbing the sound of the void.

TUBE also the wires which are connect with L. S. they carry only two voltages (2 V).

But to work the sculptor need 110 V which they go with the fine wires into the transformer and come out only 2 V. If you need the 110 V. Then you can take the current from near the coinfes out. But I hope my letter will be a help.

Yours, Takis.
